

Developments in **Routing Security**

Slides by Nathalie Trenaman

Mirjam Kühne September 2019 BCIX

Who We Are

- East and parts of Central Asia
 - Ensure unique holdership
 - Document holdership in the RIPE Database (whois)
 - Enable operators to document use of their address spaces

We manage IP and ASN allocations in Europe, the Middle

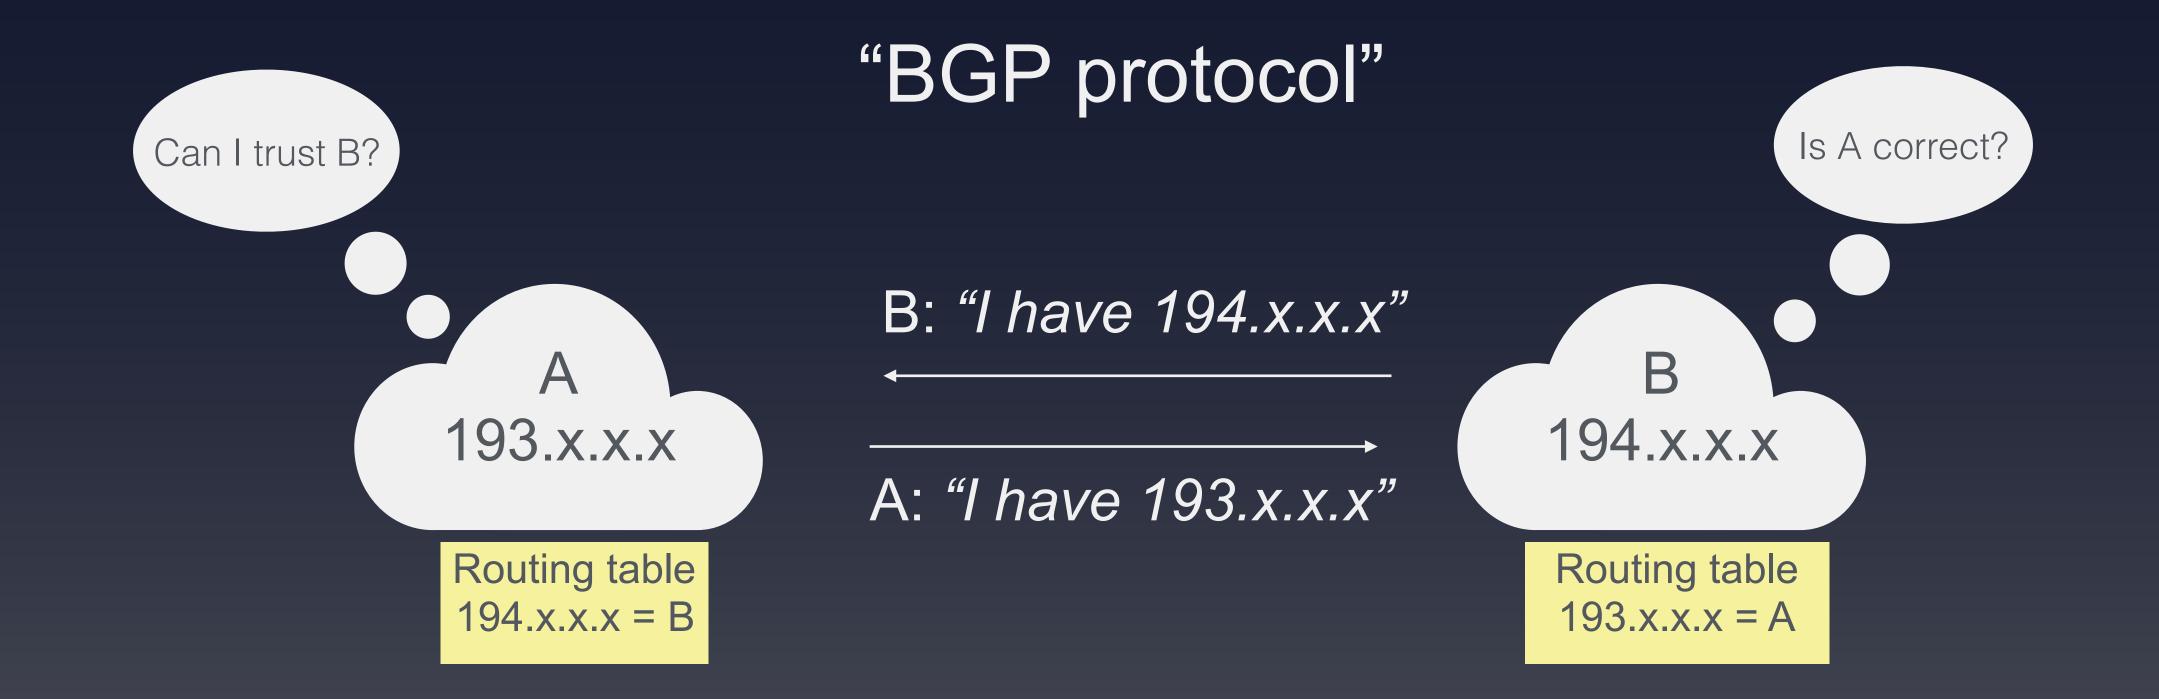

Routing Security is in Our DNA

- In 1994, RIPE-181 was the first document published that used a common language to describe routing policies
- We co-developed standards for IRR and RPKI
- We are one of the five RPKI Trust Anchors
- Our Validator tool was, until recently, the only productiongrade tool to do Origin Validation

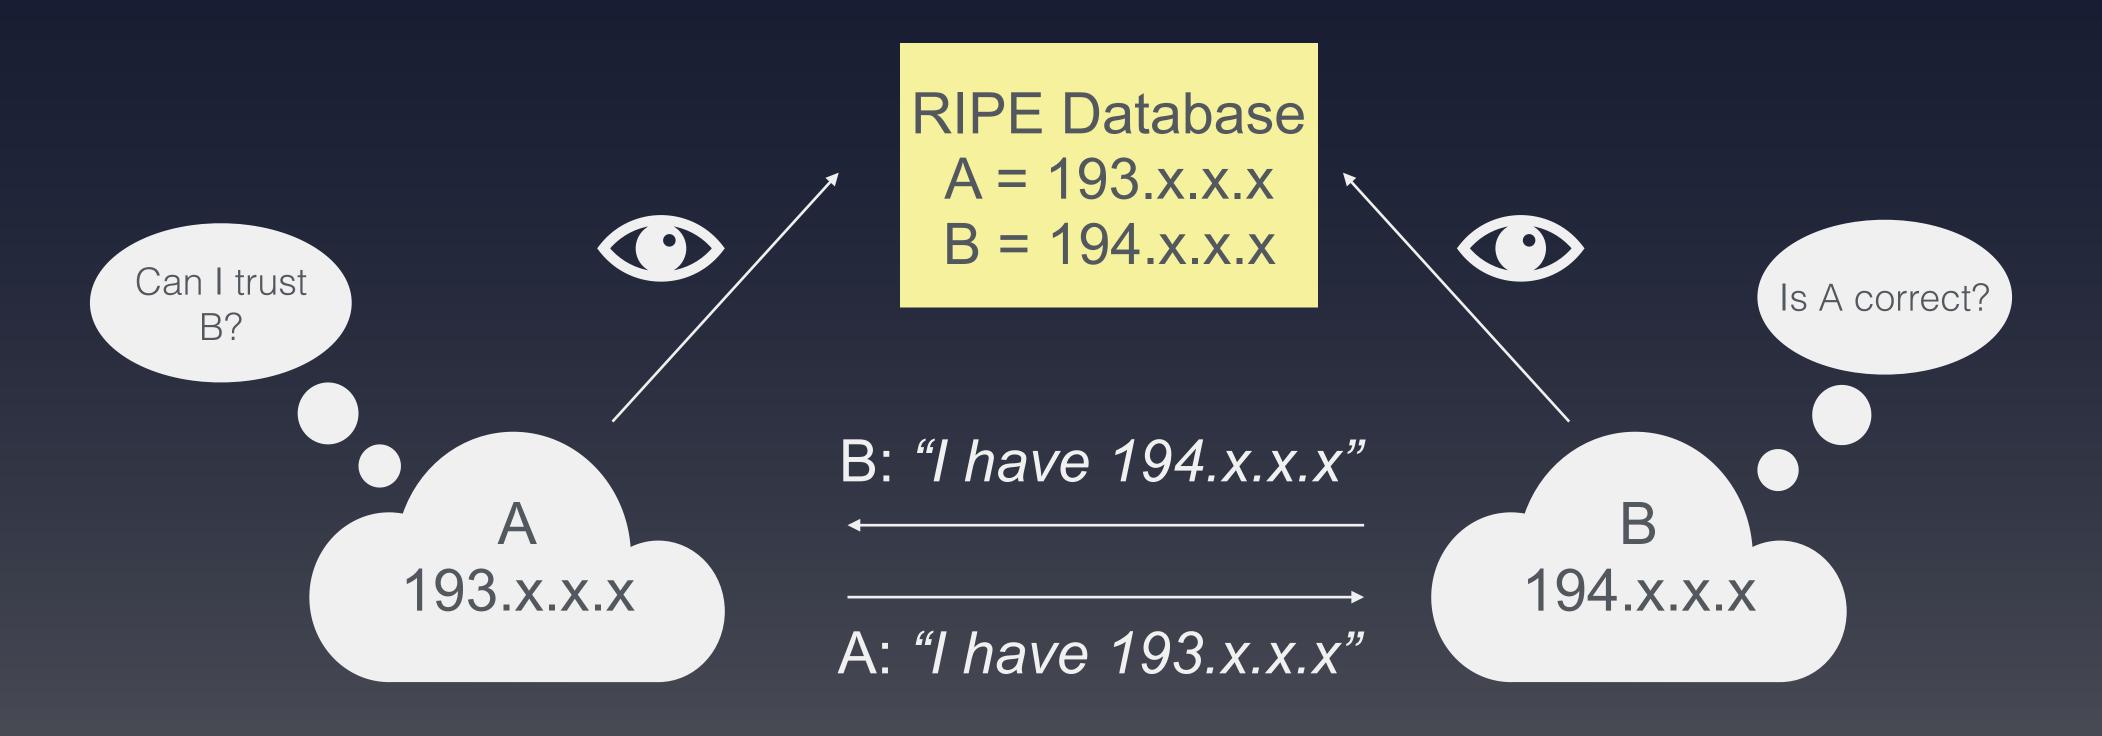

Routing on the Internet

How to Secure Routing?

"Internet Routing Registry"

Accidents Happen

• Fat Fingers

- 2 and 3 are really close on our keyboards...
- Policy violations (leaks)
 - Oops, we did not want this to go to the public Internet
 - Infamous incident with Pakistan Telecom and YouTube
 - ripe-ncc-ris-case-study

- https://www.ripe.net/publications/news/industry-developments/youtube-hijacking-a-

Or Worse...

April 2018

- BGP and DNS hijack
- Targeting MyEtherWallet
- Unnoticed for 2 hours

Incidents Are Common

• 2018 Routing Security Review

- 12.6k incidents
- 4.4% of all ASNs affected
- 3k ASNs victims of at least one incident
- 1.3k ASNs caused at least one incident

Internet Routing Registry

- Many exist, most widely used
 - RIPE Database
 - RADB
- Verification of holdership over resources
 - RIPE Database for RIPE region resources only
 - RADB allows paying customers to create any object -
 - Lots of other IRRs do not formally verify holdership

Accuracy - RIPE IRR

Accuracy - Valid announcements / covered announcements

Resource Public Key Infrastructure

RPKI

- Ties IP addresses and ASNs to public keys
- Follows the hierarchy of the registry
- Authorised statements from resource holders
 - ASN X is authorised to announce my IP Prefix Y
 - Signed, holder of Y

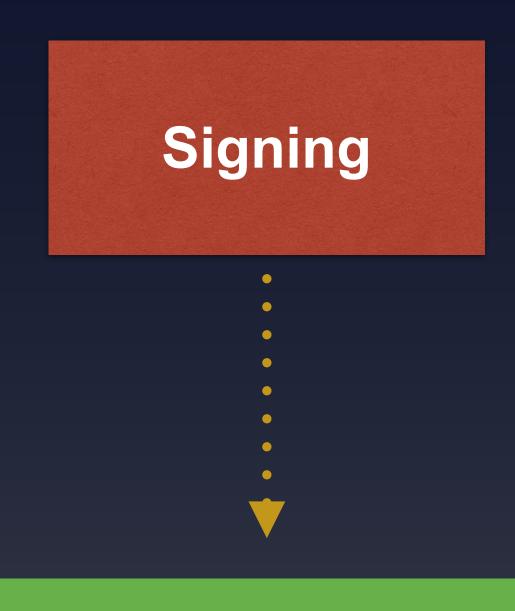

Resource Public Key Infrastructure

- Operated since 2008 by all RIRs
 - Community-driven standardisation (IETF)
 - IRR was not sufficient (incomplete, incorrect)
- Adds crypto-security to Internet Number Resources

Recommendations to Get Started

- Create your ROAs in the LIR Portal
- Pay attention to the Max Length attribute
- Download and run a Validator
- Check validation status manually, which routes are invalid? Set up monitoring, for example pmacct
- - https://github.com/pmacct/

Invalid == Reject

What breaks if you reject invalid BGP announcements?

- "Not all vendors have full RPKI support, or bugs have been reported"
- "Mostly nothing" AT&T
- "5 customer calls in 6 months, all resolved quickly" -Dutch medium ISP
- "Customers appreciate a provider who takes security seriously" -Dutch medium ISP
- "There are many invalids, but very little traffic is impacted" -very large cloud provider

Making the Difference

Is routing security on your agenda?

Initiate the conversation with providers and colleagues
